

Carmenta and the environment

Carmenta develops and sells products and services within the area of Geographic Information technology and Operative Management systems. We are constantly working to minimize the affect on the environment caused by our business and indirectly through our products and services. This is achieved through an environmental management system which promotes effectiveness and constant improvements with the aim of enabling new thinking in all channels, from an environmental perspective and from a corporate financial perspective.

Environmental policy

Carmenta should always ensure that all work is carried out with consideration to the affect on our common environment:

- We increase our knowledge and understanding of sustainable development.
- We follow environmental laws and environmental regulations, select the things that affect us and educate our staff.
- We make an effort to reduce our transportation, material and power consumption, and use environmental products.
- We recycle our waste as much as possible.
- We consider environmental aspects when purchasing external products and services.
- We use suppliers that are environmentally approved.
- We make an effort to influence indirect affect on the environmental caused by our business.
- We continually reduce our affect on the environmental through constant improvements.

Our purchasing and our suppliers

In our purchasing process, we make decisions based upon the affect our purchase will have on the environment. We therefore work according to the following principle:

1. Re-use
2. Recycling
3. Recover energy
4. Deposit (at the refuse dump)

We check that our contractors are approved according to the Environmental Protection Law and industry-specific environmental criteria.

We also prefer to purchase from suppliers that are approved according to ISA 14001 or that have an environmental policy, an environmental goal and that regularly follow up their environmental work.

Our indirect affect on the environmental

In our project work we take into consideration and try to actively have an influence on factors that affect the environment. What we try to influence:

- Emissions into the air, sea and land.
- Radiation that is harmful to human health, e.g. radioactivity, electromagnetism.
- Energy recovery, re-use and recycling.
- Use of sensitive land and aspects that cause damage to sensitive land and vegetation.
