Carmenta Server certified for web GIS standards

Open standards for data exchange are becoming all the more important within the fast developing area of web GIS. Carmenta Server was recently certified for five important international standards from Open Geospatial Consortium, Inc (OGC).

Carmenta's map solutions and products have long been used in systems with major demands on performance, flexibility and scalability. Carmenta Server provides organizations with access to well-tested server technology for the handling of digital maps and other geographic information. The product is being used, to an ever-increasing extent, to simplify distribution and the exchange of geographic data with the help of standardized web server interfaces.

As an active member of OGC, Carmenta is constantly working towards adapting and certifying its products for open solutions. On OGC's website for product comparisons it is clear which specifications are supported by the Carmenta Server, compared to other products.

"We strongly believe in geospatial standards and are proud to offer the most OGC compliant web server on the market. This will benefit our customers in the emerging SDI market," says Mikael Gråsjö, Manager, Server Products, Carmenta.

About Open Geospatial Consortium, Inc

The Open Geospatial Consortium (OGC), an international voluntary consensus standards organization, was established in 1994. The OGC brings together more than 370 commercial, governmental, non-profit and research organizations worldwide to collaborate in an open consensus process, encouraging the development and implementation of standards for geospatial content and services, GIS data processing and data sharing.
